Supplemental Material for:
Synchronization and Spatiotemporal Phases in Driven Precessing Domain Walls

I. MOVIES

- **Movie S1** (`movie_StabilityMapVsGilbertDamping.mp4`) illustrates how the spectral stability map evolves as a function of the Gilbert damping parameter α. In each frame, color indicates the magnitude of the largest Floquet multiplier for each mode at a given field value.
- **Movie S2** (`movie_BlochLineDynamics.mp4`) shows the space-time trajectories of vertical Bloch lines within a segment of a domain wall embedded in a larger DW structure. The colorbar represents the instantaneous angle $\phi(x,t)$, with Bloch lines appearing as kinks that generate the spatiotemporal pattern.
- **Movie S3** (`movie_DWBlochLinesCorrugationLLG.mp4`) Emergence of corrugations and Bloch lines in the transient domain-wall dynamics, starting from a slightly perturbed flat initial condition, obtained from LLG numerical simulations.
